This ethnographic study examines the role of differing school knowledge in reproducing various social classes in the society. It was observed that an unequal

availability of capital resources, agents' class habitus, and the type of their "cultural currency" act as selection mechanisms that clearly favour some social groups over others. The ruling classes ensure the transfer of their power and privilege to their children by providing them with quality education in elite schools. The disadvantaged classes are excluded from these unique institutions by both social and economic sanctions. They have no other option than to educate their children either in public schools or Islamic madaris. As a result, inequitable

educational opportunities consolidate the existing social-class hierarchy.

Assessment in Science combines professional development and classroom practice in a single volume. The pragmatic nature of the book makes it a valuable resource for administrators and staff developers interested in designing professional development programs, and for science teachers looking for techniques and examples of classroom-based assessments. Unique features of Assessment in Science include: 1) practical strategies and tools for implementing successful professional development programs in science assessment, 2) teacher stories and case studies about classroom-based assessment practice and how these teachers changed their assessment practice, 3) examples of classroom-based

assessments and scoring guides, 4) samples of student work with teacher commentary, and 5) examples of how the national reform documents in science education served as tools in professional development programs and in designing classroom-based assessments. Assessment in Science expands the existing literature on science assessment by sharing a model for professional development, and examples of teacher-developed assessments with accompanying student work and teacher commentary. Chapters written by science teachers tell how they assess students and how they have changed their assessment practice, as well as how changing assessment practice has resulted in a change in their science instruction. Assessment in Science is targeted at practising professionals in science education: administrators, staff developers, science teachers, and university science educators. Assessment in Science has applicability to graduate-level courses in science education and in-service courses for science teachers. The teacher chapters are also appropriate for use in undergraduate science methods

courses to illustrate classroom-based assessments.

"Climate change. Water contamination. Air pollution. Food shortages. These and other global issues are regularly featured in the media. However, did you know that chemistry plays a crucial role in addressing these challenges? A knowledge of chemistry is also essential to improve the quality of our lives. For instance, faster electronic devices, stronger plastics, and more effective medicines and vaccines all rely on the innovations of chemists throughout the world. With our world so dependent on chemistry, it is unfortunate that most chemistry textbooks do not provide significant details regarding real-world applications. Enter Chemistry in Context-"the book that broke the mold." Since its inception in 1993, Chemistry in Context has focused on the presentation of chemistry fundamentals within a contextual framework"--

This book teaches chemistry at an appropriate level of rigor while removing the confusion and insecurity that impair

student success. Students are frequently intimidated by prep chem; Bishop's text shows them how to break the material down and master it. The flexible order of topics allows unit conversions to be covered either early in the course (as is traditionally done) or later, allowing for a much earlier than usual description of elements, compounds, and chemical reactions. The text and superb illustrations provide a solid conceptual framework and address misconceptions. The book helps students to develop strategies for working problems in a series of logical steps. The Examples and Exercises give plenty of confidence-building practice; the end-of-chapter problems test the student's mastery. The system of objectives tells the students exactly what they must learn in each chapter and where to find it.

A bullet dropped and a bullet fired from a gun will reach the ground at the same time. Plants get the majority of their mass from the air around them, not the soil beneath them. A smartphone is made from more elements than you. Every day,

science teachers get the opportunity to blow students' minds with counter-intuitive, crazy ideas like these. But getting students to understand and remember the science that explains these observations is complex. To help, this book explores how to plan and teach science lessons so that students and teachers are thinking about the right things – that is, the scientific ideas themselves. It introduces you to 13 powerful ideas of science that have the ability to transform how young people see themselves and the world around them. Each chapter tells the story of one powerful idea and how to teach it alongside examples and non-examples from biology, chemistry and physics to show what great science teaching might look like and why. Drawing on evidence about how students learn from cognitive science and research from science education, the book takes you on a journey of how to plan and teach science lessons so students acquire scientific ideas in meaningful ways. Emphasising the important relationship between curriculum, pedagogy and the subject itself, this exciting book will help you teach

in a way that captivates and motivates students, allowing them to share in the delight and wonder of the explanatory power of science.
