Biological sciences have been revolutionized, not only in the way research is conducted -- with the

introduction of techniques such as recombinant DNA and digital technology -- but also in how

research findings are communicated among professionals and to the public. Yet, the undergraduate

programs that train biology researchers remain much the same as they were before these

fundamental changes came on the scene. This new volume provides a blueprint for bringing

undergraduate biology education up to the speed of today's research fast track. It includes

recommendations for teaching the next generation of life science investigators, through: Building a

strong interdisciplinary curriculum that includes physical science, information technology, and

mathematics. Eliminating the administrative and financial barriers to cross-departmental

collaboration. Evaluating the impact of medical college admissions testing on undergraduate biology

education. Creating early opportunities for independent research. Designing meaningful laboratory

experiences into the curriculum. The committee presents a dozen brief case studies of exemplary

programs at leading institutions and lists many resources for biology educators. This volume will be

important to biology faculty, administrators, practitioners, professional societies, research and

education funders, and the biotechnology industry.

Concepts of Biology is designed for the single-semester introduction to biology course for non-

science majors, which for many students is their only college-level science course. As such, this

course represents an important opportunity for students to develop the necessary knowledge, tools,

and skills to make informed decisions as they continue with their lives. Rather than being mired

down with facts and vocabulary, the typical non-science major student needs information presented

in a way that is easy to read and understand. Even more importantly, the content should be

meaningful. Students do much better when they understand why biology is relevant to their

everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and

includes exciting features that highlight careers in the biological sciences and everyday applications

of the concepts at hand. We also strive to show the interconnectedness of topics within this

extremely broad discipline. In order to meet the needs of today's instructors and students, we

maintain the overall organization and coverage found in most syllabi for this course. A strength of

Concepts of Biology is that instructors can customize the book, adapting it to the approach that

works best in their classroom. Concepts of Biology also includes an innovative art program that

incorporates critical thinking and clicker questions to help students understand--and apply--key

concepts.

In Volume III, as in Volumes I and II, the classic topics of reading are included—from vocabulary and comprehension to reading instruction in the classroom—and, in addition, each contributor was asked to include a brief history that chronicles the legacies within each of the volume's many topics. However, on the whole, Volume III is not about tradition. Rather, it explores the verges of reading research between the time Volume II was published in 1991 and the research conducted after this date. The editors identified two broad themes as representing the myriad of verges that have emerged since Volumes I and II were published: (1) broadening the definition of reading, and (2) broadening the reading research program. The particulars of these new themes and topics are addressed.

In an era of globalization and urbanization, various social, economic, and environmental challenges surround advances in modern biological sciences. Considering how biological knowledge and practice are intrinsically related to building a sustainable relationship between nature and human society, the roles of biology education need to be rethought to respond to issues and changes to life in this biocentury. This book is a compilation of selected papers from the Twenty Third Biennial Conference of the Asian Association for Biology Education 2010. The title, Biology Education for Social and Sustainable Development, demonstrates how rethinking and reconstruction of biology education in the Asia-Pacific region are increasingly grounded in deep understandings of what counts as valuable local knowledge, practices, culture, and ideologies for national and global issues, and education for sustainable development. The 42 papers by eminent science educators from Australia, China, Philippines, Singapore, Taiwan, and the U.S., represent a diversity of views, understandings, and practices in biology education for sustainable development from school to university in diverse education systems and social-cultural settings in the Asia-Pacific region and beyond. The book is an invaluable resource and essential reference for researchers and educators on Asian perspectives and practices on biology education for social and sustainable development.
